

React Developer Challenge

1. Topic

Implement a nested to-do list in React using Redux to manage the application state. You are free to use any libraries/frameworks and can be as creative as you want with your styling and representation.

2. Guide

The implementation should be able to perform the following operations:

- Create a task
- Create 0...n number of tasks under any task
- Removal of a task when marked as done
- When a parent task is marked as done all child tasks up to the maximum depth from the parent node should be removed as well

Bonus points if you use functional components with hooks to implement your solution.

Submissions can either be sent as a zip file or as a link to a repository containing your code.
